Falcon Platform — New Engineer Onboarding Guide

Orbital Robotics Pvt Ltd — Internal Engineering Documentation

Welcome to the Falcon team. Falcon is Orbital Robotics' internal fleet-management platform for autonomous warehouse robots. This guide covers what a new backend engineer needs to get productive in the first two weeks.

Week 1: Environment Setup

Install Docker Desktop, clone the falcon-core repository, and run 'docker compose up' to start the local development stack. The stack includes PostgreSQL, Redis, and the Falcon API service. Request VPN access from IT before attempting to connect to the staging cluster.

Week 1: Codebase Orientation

Falcon-core is a Spring Boot microservices application. The three primary services are 'fleet-manager' (robot state and task assignment), 'route-planner' (path optimization), and 'telemetry-ingest' (sensor data collection). All services communicate over gRPC and publish events to a shared Kafka topic named 'falcon.events'.

Week 2: Your First Ticket

New engineers are typically assigned a small bug fix in 'telemetry-ingest' as their first ticket. Pull requests require at least one approval from a senior engineer before merging, and all code must pass the CI pipeline including unit tests and the linter.

Team Contacts

The Falcon engineering lead is Rahul Mehta. For infrastructure and deployment questions, contact the Platform team lead, Ananya Rao. For onboarding logistics or laptop/equipment issues, contact IT support at it-support@orbitalrobotics.example.
